

Quarterly report September 2023

Markets

How different the markets played out so far than many strategists predicted. Actually 180 degrees different than predicted. Equity markets would fall in the first half and to resurrect thereafter. But the rapid fall in inflation drove down yields while labor markets didn't give in. The expected profit recession didn't unfold and actually the idea of a soft landing or no landing at all, got foothold. Though, Central Banks were not willing to acknowledge that inflation was retrieving and that overtime, the steps up interest rates would be feeding through. The mantras "we have more ground to cover" was repeated endlessly, as, "we will keep interest rates high", "don't underestimate us in fighting inflation", "may be one more hike". The truth is that the FED actually haven't increased rates now for the last 6 months. A lot of lip service was done with the intention to make sure that yields across the curve didn't drop in anticipation of lowering Fed rates as inflation falters and economic growth softens. That would undermine the inflation fight (for now). And just putting your money where your mouth is(another couple of hikes), seemed too much as the hikes are doing their intended work and more would undermine economic growth. That didn't prevent the bond markets from taking the FED word for granted. (which is actual quite silly, seen the track record of Central Banks lately). But anyway, they ignited a selloff in bonds of historical proportions. And of course it is never one reason but a cocktail of circumstances, like heavy supply of debt, higher oil price, rising sovereign budget deficits, China selling, but not in the least, positioning. As strategist predicted equity markets to falter, they advised to overweight bonds. Now that total return on bonds have become quite negative, risk limits have been surpassed, triggering automatic selling and withdrawal of capital, exacerbating the rise of yields. And that is for equity markets, right now, too much to bear.

Portfolios

Initially markets moved further sideways on low volumes. But as interest rates rose further equities slipped slighted away. Contradicting signals kept investors on the side. On one hand inflation keeps falling and labor, income and spending keep up. With stimulus in China as the wildcard. But bond markets tell a different story and are keeping a hand on the lit for a lift off. As expressed above, the how and why yields are rising makes equity investor wary of taking yield curve moves as too serious and hang into the medium term story line. So do we. Positioning distort the picture of falling inflation/rates which will soon resurface. If there is economic weakness in the pipeline, it is here and right now. In the months to come restocking is more likely than destocking, more stimulus in China more likely than not. And valuations apart from US big IT deem attractive. Especially these from smaller companies in Europe and VS as recession is written again, as in 2022, with a big R. What is missing is sustained rally in bonds(and Euro). If there is a real threat, it is probably CB's doing too much, i.e. not timely acknowledge that inflation has retreated. Seen the light positioning in equities by international investors, especially in Europe, it looks like the downside is limited while equity yields are attractive. That is why we hang in for now, although our sector preference doesn't stroke with current bond market behavior and cut off levels are not to far away.

Outlook

Markets going nowhere view didn't hold up. In the end as investors became totally apathic, machine trading took over, arbitrating bonds versus equities and taking equity markets lower. Prospects will not take over before positions are adjusted We still hold the view that inflation is retreating and Cb's will act accordingly in the first half of 2024. Instead of a headwind, yields will offer some tailwind. It Is not likely that economic growth will reaccelerate strongly, but stable growth will be enough. China stimulus is still in the cards. And as bonds in Europe still offer no real value, equities over bonds are to be favored as they offer better compensation for lower but embedded inflation longer term. In the US, asset allocation favors bonds for now versus Growth (IT) companies. This will drive yields down as the real compensation hasn't been this generous for a long time. This could make the Magnificent Seven (Amazon, Alphabet, Google, Meta, Nvidia, and Tesla) rangebound but offer support for locals and stocks with Asian exposure. Not a good feeding ground for index products, but the more for stockpickers.
